

# **Does A Picture Really Paint A Thousand Words?** A Study On The Technical Qualities Of Online Aesthetic Oculofacial Clinical Photographs

Beacon International Specialist Centre, Kuala Lumpur<sup>1</sup>; University Malaya Medical Centre, Kuala Lumpur, Malaysia<sup>2</sup>; University of Leeds, United Kingdom<sup>3</sup>.

## Introduction

Clinical photographs are useful for clinical records. surgical treatment planning, and in audit, education research, supporting medico-legal cases.<sup>(1)</sup> Since the internet is a resource most readily available to the general public, nonstandardized online clinical images may potentially mislead unsuspecting readers.

#### Aim

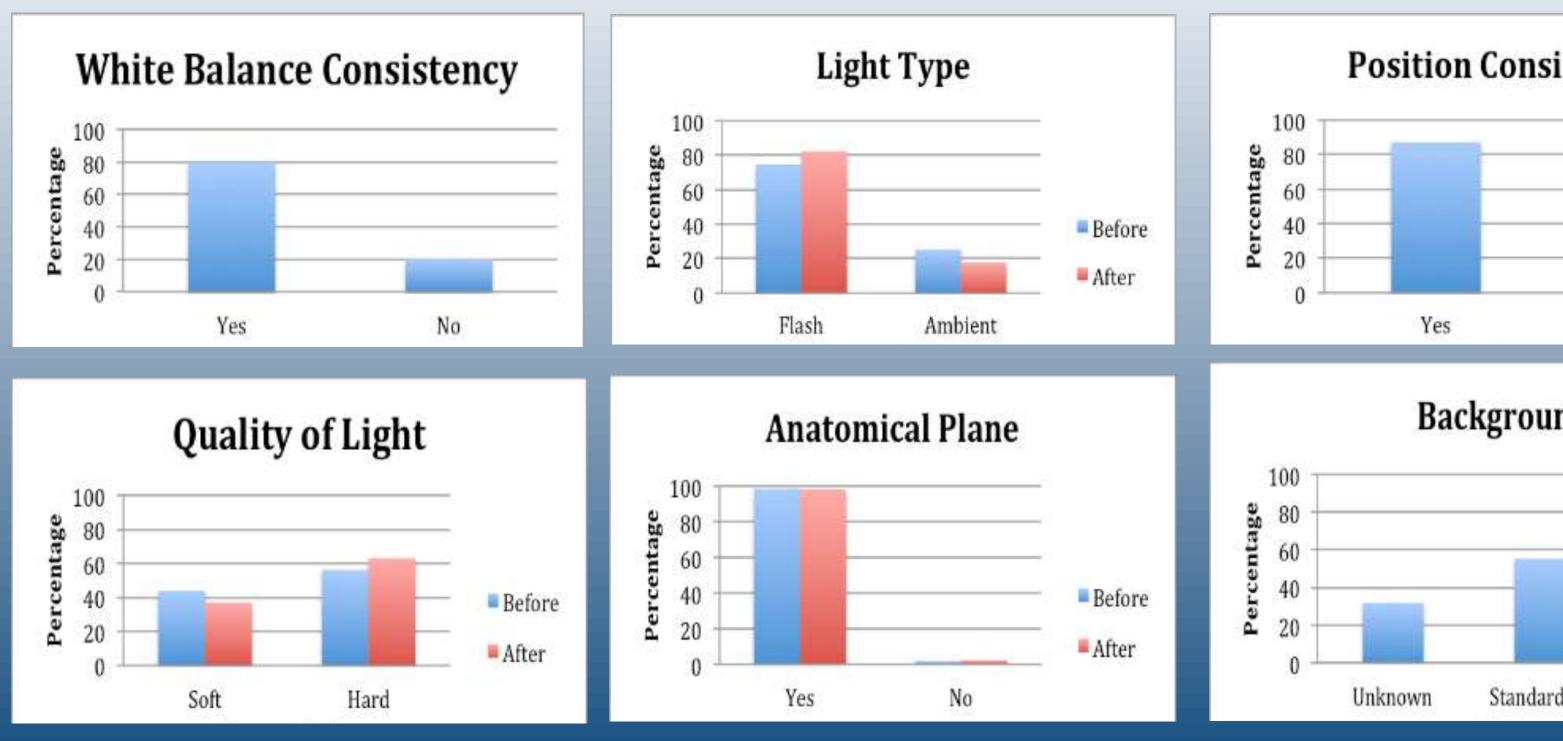

This study asses the photographic qualities of online clinical images.

### **Methods and Material**

Clinical images were searched from the internet (www.google.com.my) with several keywords used in 6 possible combinations. The 6 different combinations are 'Pre and post blepharoplasty', 'Pre and post Botox', 'Pre and post cosmetic surgery', 'Before and after blepharoplasty', 'Before and after and "Before and after cosmetic Botox' surgery". All online images identified using the keyword combinations were downloaded in their highest resolution. All images were graded according to the Institute of Medical Illustrators (IMI) recommended photographic standards,<sup>(4,5)</sup> by a qualified medical photographer (T Zoltie).

A total of 1027 images were downloaded and assessed. 17.1% images fulfilled all the IMI criteria in pose, lighting, and standardisation. 98% of images were posed correctly. 79% of images were taken with flash photography but 54% of those images did not fulfil the recommended lighting techniques. 41% of images were inconsistent in the photographic method before and after the procedure.

# Conclusion

Online clinical photographs for aesthetic patients are generally taken with no photographic standardization. This may potentially mislead patients on the effectiveness of oculofacial cosmetic procedures.
